Color discrimination is normal after delayed bilateral congenital cataract surgery

*Kabilan Pitchaimuthu, Suddha Sourav, Davide Bottari, Seema Banerjee, Idris Shareef,
Ramesh Kekunnaya, and Brigitte Röder*

> 6 months of visual deprivation from birth due to bilateral congenital cataracts

Sight restoration by cataract surgery and > 1 year for visual recovery

Normal color arrangement

Development of color discrimination does not depend on typical visual experience during a sensitive phase in early infancy. Hence, colorful objects can be used in visual rehabilitation of kids with congenital visual deprivation.
